Download

The software can be easily integrated with any hotel management system. Example application A hotel chain in South India has an operation of 3,00,000 Rooms, with more than 40,000 employees to manage it. They were running a customized software for their hotel management that was not easy to use. For such a large application, they were looking for something easier to maintain with a solution that could be easily customized. Enterprise application Management Software from enterprise application management (EAM) is a middle ground between ERP and custom software that is easier to maintain and install. The solution is vendor-independent and can be integrated with an organization's existing database, HR system, or accounting software. Advantages of Enterprise Application Management Good for non-custom software Software management and maintenance becomes the responsibility of the vendor instead of the end-user. It allows you to receive support from a professional team of software engineers instead of the developer or programmer of the software. Easy to Implement You can customize EAM software to fit your business needs. If you don't have the resources to develop your own application, you can outsource it to software developers. Ease of use EAM software can easily be installed and managed. It offers excellent functionality and simplicity with easy to learn user interface. Disadvantages of Enterprise Application Management Relatively high cost Though EAM offers many benefits, it can be expensive to purchase it from the vendor. Limited support The end-user of the system is the vendor of the software, so you won't receive support from a professional team of software engineers. You

will only receive support from the vendor of the software. Scalability The software may not be scalable if you run into an exponential increase in business or demand for data. Unreliable and unpredictable performance Depending on the quality of the vendor's application, the system may not scale. Therefore, the performance of the software may not be predictable. Lack of customization The software is not customizable, so you won't be able to change the design or functionality. Benefits of Enterprise Application Management Available on the web You can choose from a number of solutions such as simple-to-use, easy-to-install, and low-cost. The cost for EAM solutions are 82157476af
